

MAXI/GUARD® for EXOTICS

Benefits of Zn7® Derm & Spray

- Supportive treatment for bumblefoot in birds
- Treatment of skin lesions
- Feather picking
- Lamp burns
- Zinc concentration safe for all exotics

What people are saying about Zn7 Derm for exotics:

"I have used it multiple times now on different species with great success. Your product is currently my supportive treatment of choice for bumblefoot in birds. I have had the chance to use it a few times on different sized lesions and I have had only the best results."

"Simon, a very nice rat was presented to me after a series of unsuccessful tries to cure a cutaneous lesion on his back. I sent the owner home with Zn7 Derm. After 1 week, a significant improvement is clearly visible and after 3 weeks the original lesion is completely resolved with new hair growing at the assaulted site. Of course, the rat, the owner and myself are extremely happy with your product." - Joerg Mayer, DVM

Day 7

Day 0

Day 17

Dr. Joerg Mayer was presented with this rabbit which had a case of chronic upper respiratory infection (Bordetella, Pasteurella mix). Baytril was used for a while and the rabbit got better. When Baytril was stopped, the rabbit got worse. The rabbit was put on florfenicol (Nuflor). Zn7 Derm was used as an aid for healing, not as a primary remedy. The client applied Zn7 Derm twice a day for 2 days and reported the area was nearly gone.

"Chloe is a 12 year old rescue that came to me plucked and with 2 open wounds from self mutilation. Your product was GREAT! Chloe did not play with the area after Zn7 application. I think one of the biggest reasons for this is that it is NOT a thick cream. Healing time was FAST and she regrew down plus feathers!" - Jenniffer Crider, La Marque, TX

MAXI/GUARD® for EXOTICS

MAXI/GUARD® Oral Cleansing Gel

- Resolving and managing stomatitis in iguanas and snakes
- Low grade sinus inflammation in birds
- Helps reduce oral inflammation
- Zinc concentration safe for all exotics
- Management protocol for stomatitis secondary to dental malocclusions in rabbits

What people are saying about MAXI/GUARD® Oral Cleansing Gel for exotics:

"I have found that the gel is invaluable in resolving and managing stomatitis in iguanas and snakes. I have noticed that by adding the gel to the protocol, the animal does not need to be on antibiotics for as long a time - in fact, in a lot of cases, I have not used antibiotics at all and have seen complete resolution.

Another animal I see that often presents with oral disease is the rabbit. These animals often suffer from stomatitis secondary to dental malocclusion. I deal with the teeth and the abscesses in the traditional way and add the Oral Gel to the management protocol. I find these little guys are recovering more quickly, eating better, and gaining weight back faster since I started giving them the gel. They seem not to find the gel offensive and will accept it with little or no objection.

I have had similar results in Amazon parrots with chronic, low grade inflammation in their sinuses. A drop or two in the mouth daily is all it takes to calm the inflammation in the choana when the bird has flare-ups."

-Michael Doolen, DVM (Oakhurst, New Jersey)
